Nepal flood impact | Situation report

Syapru Besi | Event date: 26 August 2026

UNVALIDATED CANDIDATES - not confirmed damage or road closures

Evidence scope

Frozen run nepal-syapru-004. Sentinel-1D observations: 16 and 28 August 2026; Sentinel-2: 12 and 27 August. Historical OpenStreetMap snapshot: 27 July. Analysis grid: 10 m, EPSG:32645. Paired valid SAR coverage: 31,838 pixels within the irregular official AOI; the raster rectangle also contains masked pixels.

Saved calculation	Official AOI result
Water-candidate area	36,100 m2
Intersected buildings	1
Intersected road / bridge length	87.40 m
Intersected bridge features	2
Debris-candidate area	212,300 m2
Settlement isolation	Unresolved; not zero

Interpretation and limits

Water candidates come from fixed SAR thresholds. The debris proxy detects vegetation loss to bare ground with SAR change; it may confuse clearing or agriculture and miss deposits on already bare ground. Intersections indicate exposure, not asset damage. Unknown observations, boundary-truncated road components and unverified snapping prevent a definitive settlement-isolation conclusion.

Reference check

One-AOI diagnostic agreement with EMSR927 landslide mapping: IoU 0.328, F1 0.494, recall 0.328. Reference class, timing and resolution differ. This is not independent validated debris accuracy. No compatible water accuracy score is claimed.

Traceability

Inspect result.json, exposure.csv, debris-exposure.csv, connectivity.json, topology-audit.json and freeze.json in Workspace. This report uses the official AOI run; automatic rectangular-area runs have different coverage and counts.
